Summary

Backend engineer proficient in Golang, Python, and TypeScript. Has experience engineering distributed systems and microservices, with a track record of delivering measurable performance improvements in production environments.

Skills

Programming Languages: Golang, Python, TypeScript, JavaScript, HTML, CSS

Tools: PostgreSQL, Redis, Docker, Nginx, NATs, MongoDB, MySQL, DynamoDB, Cassandra, Git

Frameworks: FastAPI, Express.js, Vue.js, Fastify.js, Prisma ORM

Platforms: Google Cloud Platform, Amazon Web Services, Azure, Linux, GitHub, DockerHub

Experience

Backend Developer Intern — Omnia WorkSpace

2025 – 2026

TypeScript service development of an AI-enabled workspace platform.

Remote

- Reduced API request volume by 10x by implementing HTTP request batching across Google API repositories.
- Implemented a cache-aside layer in TypeScript and Redis to store user information from third-party services, increasing read throughput by 50x and reducing quota usage.
- Integrated OAuth-based user authentication into a microservice with a large-scale domain model to ensure secure resource sharing between local and third-party systems.
- Engineered snapshot-based test suites which were integrated into an Azure CI/CD pipeline for reliable deployments.

Projects

GoLive - Live Streaming Platform

2022 – 2023

Golang, Vue.js, Redis, MongoDB

github.com/Sidney-Bernardin/Go-Live

- Architected an RTMP/HLS live video streaming platform across 2 horizontally scalable Golang microservices communicating over Pub/Sub and gRPC, enabling a partition-tolerant, event-driven architecture.
- Implemented real-time chat rooms using Redis-Pub/Sub and WebSockets, enabling concurrent live user interactivity.
- Configured Nginx as a reverse-proxy gateway and RTMP media server to distribute requests evenly across microservice instances.

Gitogether - Git Repository Hosting Web Application

2026

Python, FastAPI, PostgreSQL

github.com/Sidney-Bernardin/Gitogether

- Developed a full-stack Git repository hosting web application by exposing low-level Git RPC operations behind HTTP endpoints, enabling asynchronous multi-user collaboration.
- Designed user and repository relationships in PostgreSQL to synchronize application data with Git objects.
- Engineered repository forks and an atomic pull-request pipeline with merge conflict handling, supporting a feature-based workflow for multiple users.

Urithiru - TCP Load Balancer

2024 – 2025

Golang, TCP

github.com/Sidney-Bernardin/Urithiru

- Engineered a layer-4 TCP-based load-balancer using advanced Golang concurrency techniques, enabling multiple reverse-proxies to be configured and run as a single service.
- Optimized memory usage after monitoring PPROF diagnostics by adjusting buffer sizes per TCP connection.
- Integrated TLS support through TOML configuration files, ensuring secure use for web-facing deployments.

Certifications
